

Under Elmene & Leifsgade

SHORT DESCRIPTION

In Copenhagen, waterproof construction pits were created in the street area in the immediate vicinity of residential buildings for the new construction of the underground car parks “Under Elmene” and “Leifsgade”.

THE PROJECT

The overlapping bored pile walls of the approx. 14 m deep construction pits were partially secured against “pressing groundwater” with BBV strand anchors (11 strands, lengths of 27.00 m; test load 2.4 MN).

Approx. 300 BBV injection piles were required to secure the building floors against buoyancy.

FACTS

Location Copenhagen, Denmark

Status	completed
Start of construction	October 2008
Completion	July 2009

SERVICES

Excavation pits
